

A Study on Grocery Management Systems Using MERN Stack

Abstract

The Grocery List Manager is a web-based application designed to simplify grocery management using modern web technologies. It uses the MERN stack to enable efficient handling of grocery data.

Introduction

Managing daily tasks such as grocery shopping can be simplified using web applications. This project demonstrates how MERN stack can be used to build such systems.

Objectives

- Develop a user-friendly system - Implement CRUD operations - Integrate frontend and backend - Store data using MongoDB

Methodology

The application uses React.js for frontend, Node.js and Express.js for backend, and MongoDB for database storage. REST APIs are used for communication.

Features

- Add items - Delete items - Mark items as purchased - Categorize items - Checkout system

Conclusion

The project shows how MERN stack can be used to build scalable applications for everyday tasks like grocery management.
